Introduction

Project Overview:

- Goal: As a team, we are working on a map interface for future integration with Socian Technologies. Our project will primarily be based on the exploration of drone mapping with a focus on first responder communication, general map and data visualization, vision sensor integration, rival drone research, artificial intelligence assimilation, and analysis of stakeholders.
- For Socian Technology, our team has to design a mapping interface or aspects of drone mapping that will be used by the drone dispatcher and potentially conveyed to police officers

Deliverables:

- Project Documentation
- Low and High Fidelity Mockups
- Prototype: Mapping Interface used by 911 Dispatcher
- Slide Deck: Prepared project process deck for Presentation Day
- Recorded Presentation - A walkthrough of our project and designs:
https://youtube.com/playlist?list=PLZv2uVcl3-EvbbtQS_Te3ATlem-lhISt7

Stakeholders:

- 911 Operators
- First Responders (Police Officers & Firefighters)
- 911 Dispatcher
- Socian's sponsors
- Pedestrians
- Criminals

User group

- Focusing on 911 dispatchers who will be interacting with the mapping interface

Introduction of Final Design

We will present our final design through a user story of a 911 dispatcher.

The screens show the different points of the reporting and responding of an incident

1. Dispatcher waiting for a call, just basic permanent information of drone and unit locations
2. Call being made, highlighting the drone that will respond as well as marking the exact locations of the caller and point of interest
3. Incident Report and start of incident response (by drones and units)
4. The drone searching the area
5. An 'after-the-fact' forensic view of the incident

Final Design Walkthrough

Key:

These boxes describe the "story" of the screens. What's supposed to be happening on each page or an overview if not part of story

These purple text boxes highlight the features of the new dispatcher map system

911 Dispatcher Waits for Call

As the dispatcher awaits a call and there are no drones active, this is what their map screen will display.

As seen by these three clickable buttons, the dispatcher can easily search locations, change the map style of the map, or access the chat with the drone system's AI

1. On top of visually showing the police unit and the direction they are facing you could show the status of the vehicle provided by the glow around the vehicle

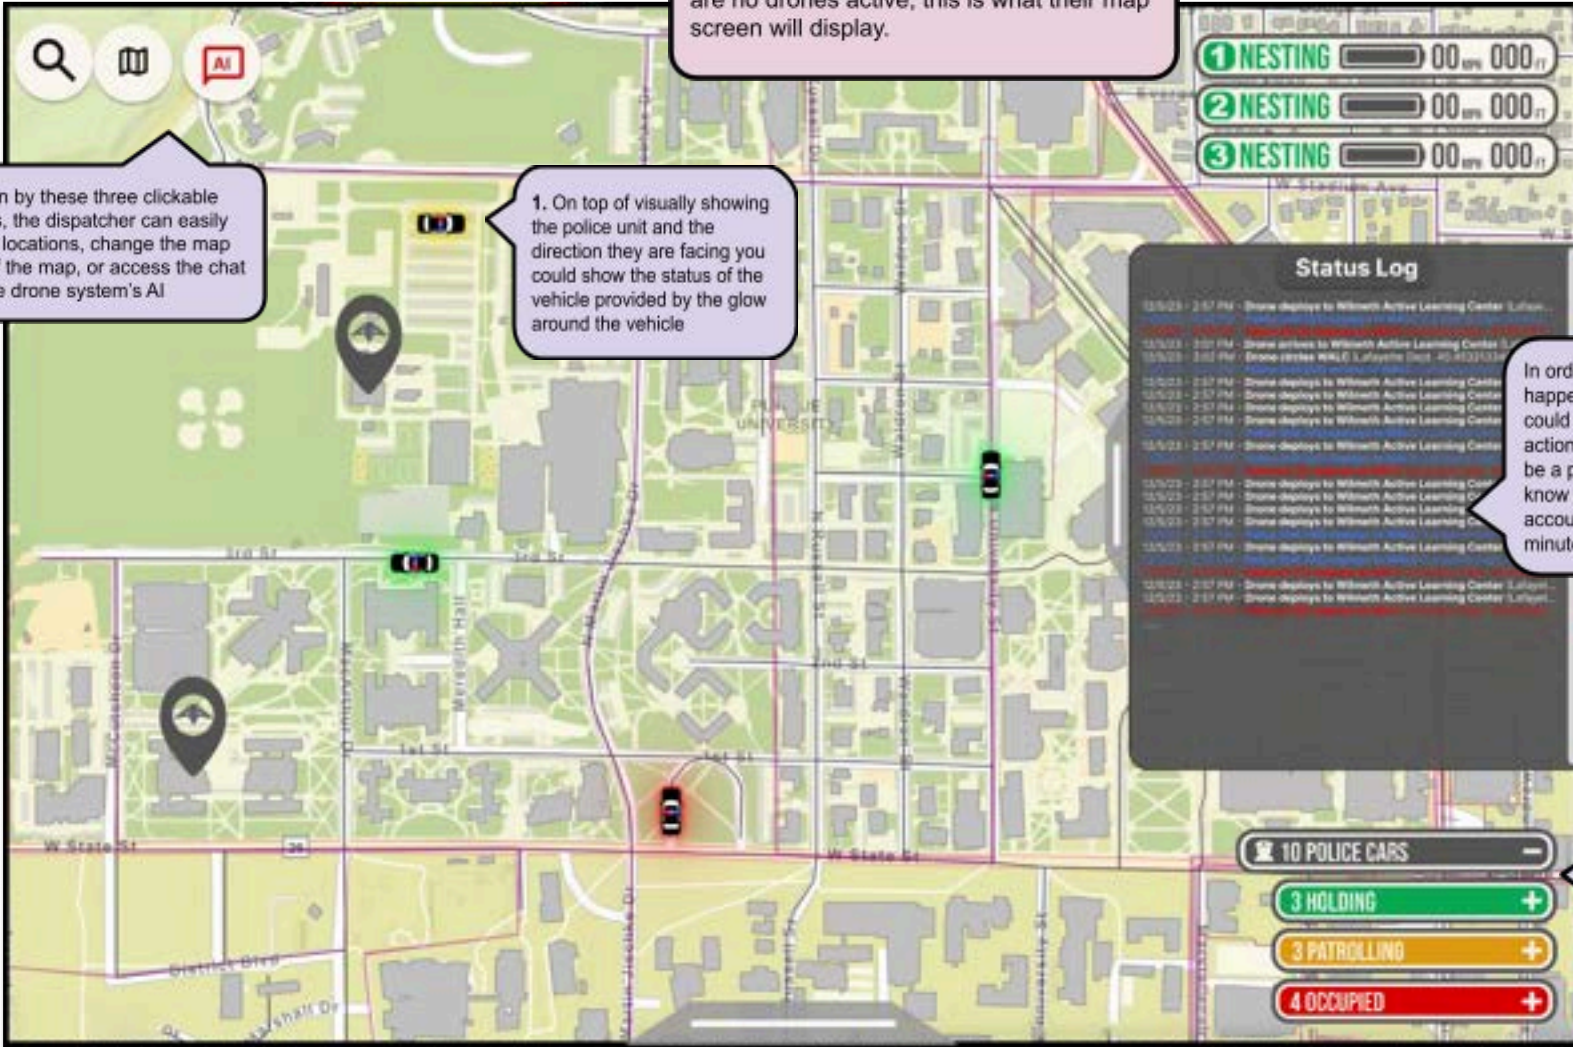

1 NESTING 00:00
2 NESTING 00:00
3 NESTING 00:00

| Status Log | |
|-------------------|--|
| 11/5/23 - 2:57 PM | Drone deploys to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone arrives to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone circles WALE Lafayette Blvd - 40-41231334 |
| 11/5/23 - 2:57 PM | Drone deploys to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone arrives to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone deploys to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone arrives to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone deploys to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone arrives to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone deploys to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone arrives to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone deploys to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone arrives to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone deploys to Wilmerh Active Learning Center - Lufkin |
| 11/5/23 - 2:57 PM | Drone arrives to Wilmerh Active Learning Center - Lufkin |

In order to convey EVERYTHING that's happening, there could be a status log that could be toggled on to see every decision and action made by drones and units. This could be a preferred method by some dispatchers to know what's happening as well as increasing accountability by detailing every action by the minute

10 POLICE CARS -
3 HOLDING +
3 PATROLLING +
4 OCCUPIED +

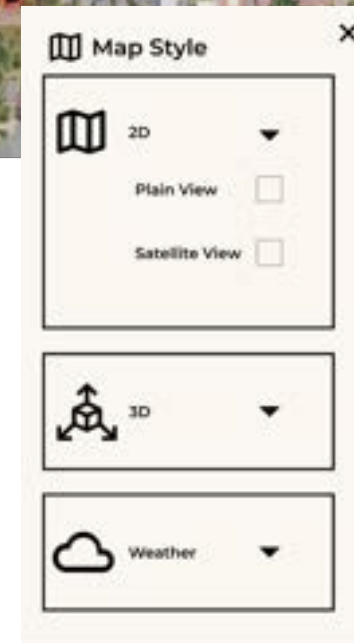

2. This dropdown shows the number of units in total as well as each by their status (whether that be sitting in a parking lot or actively patrolling or inactive)

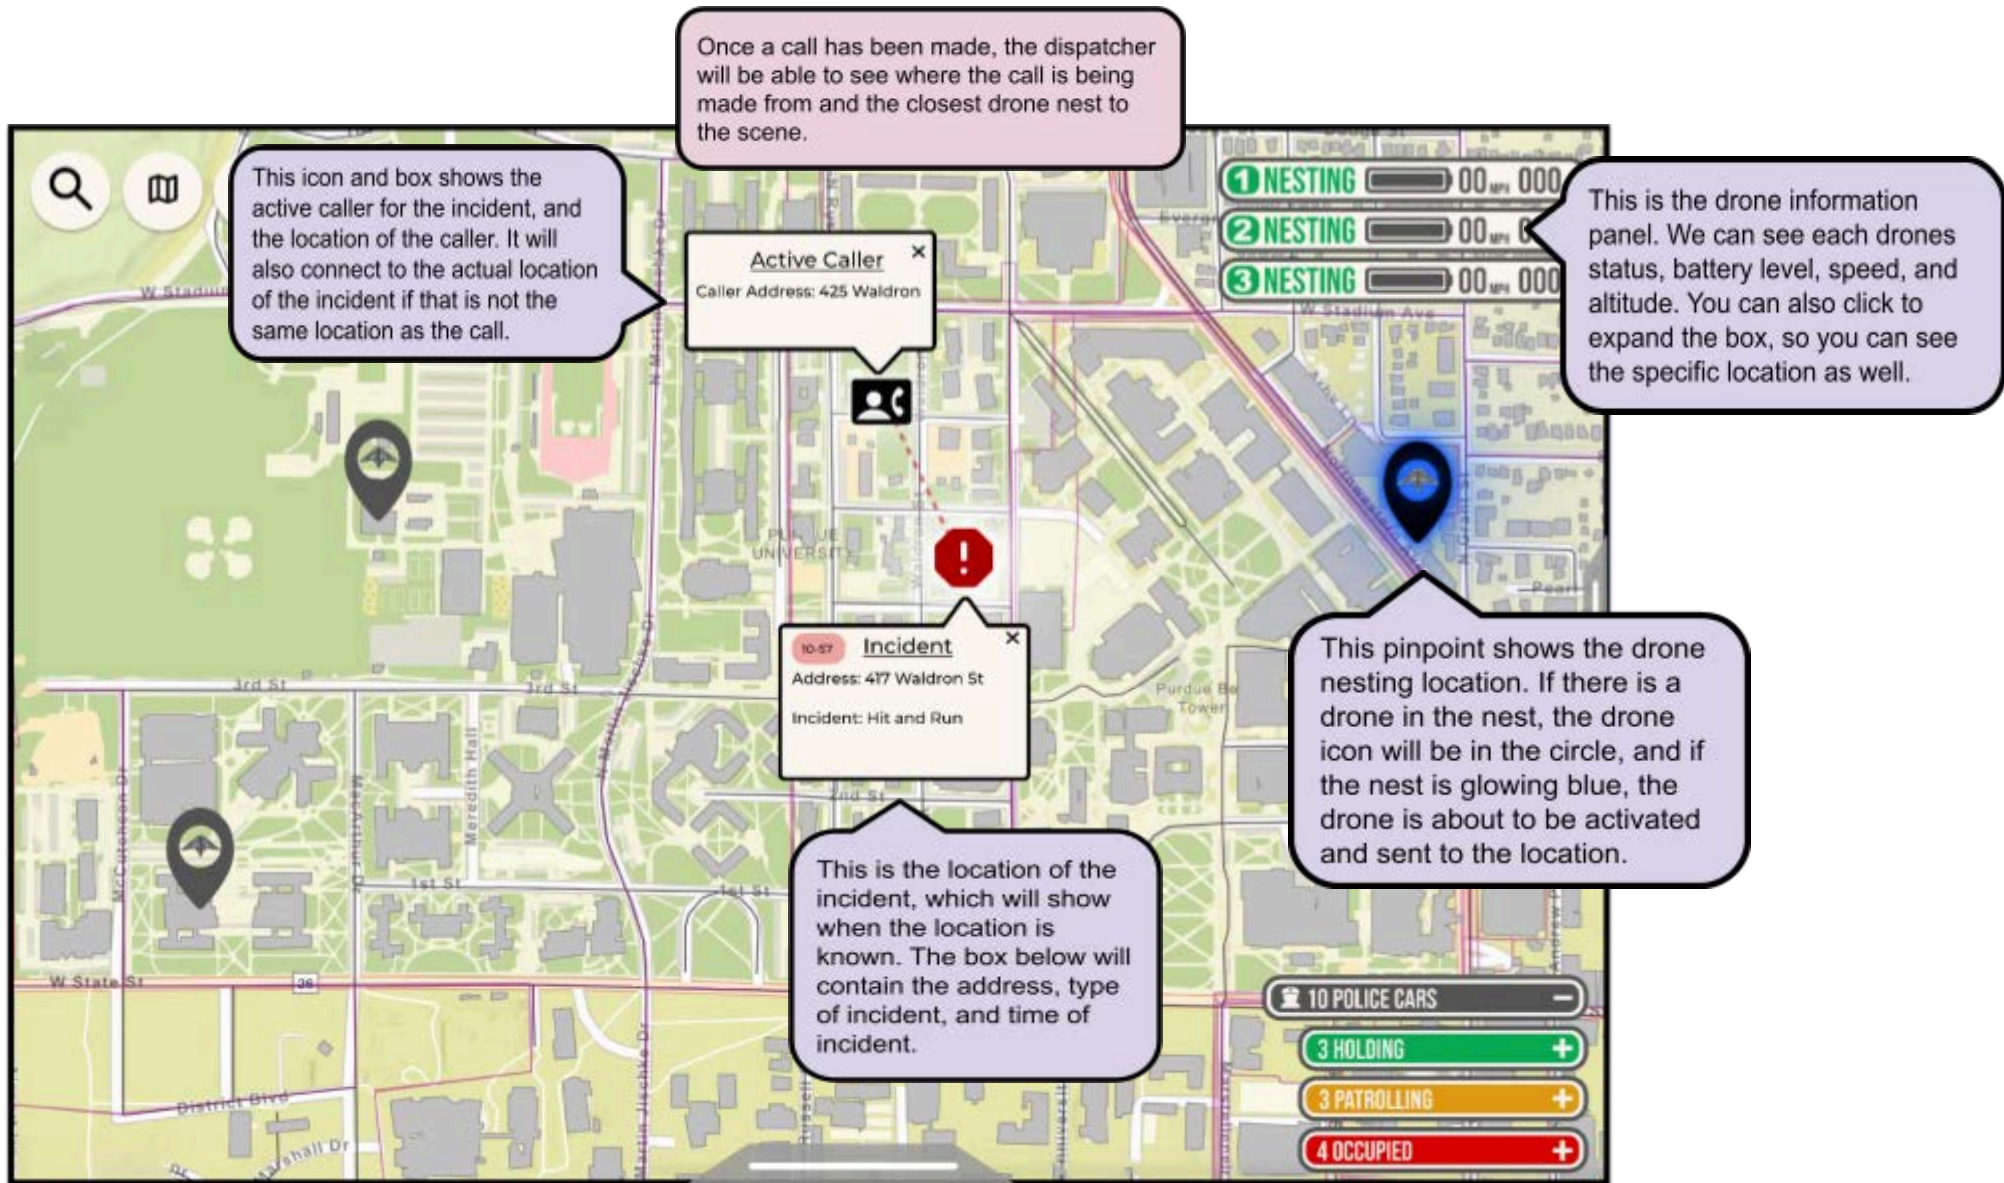

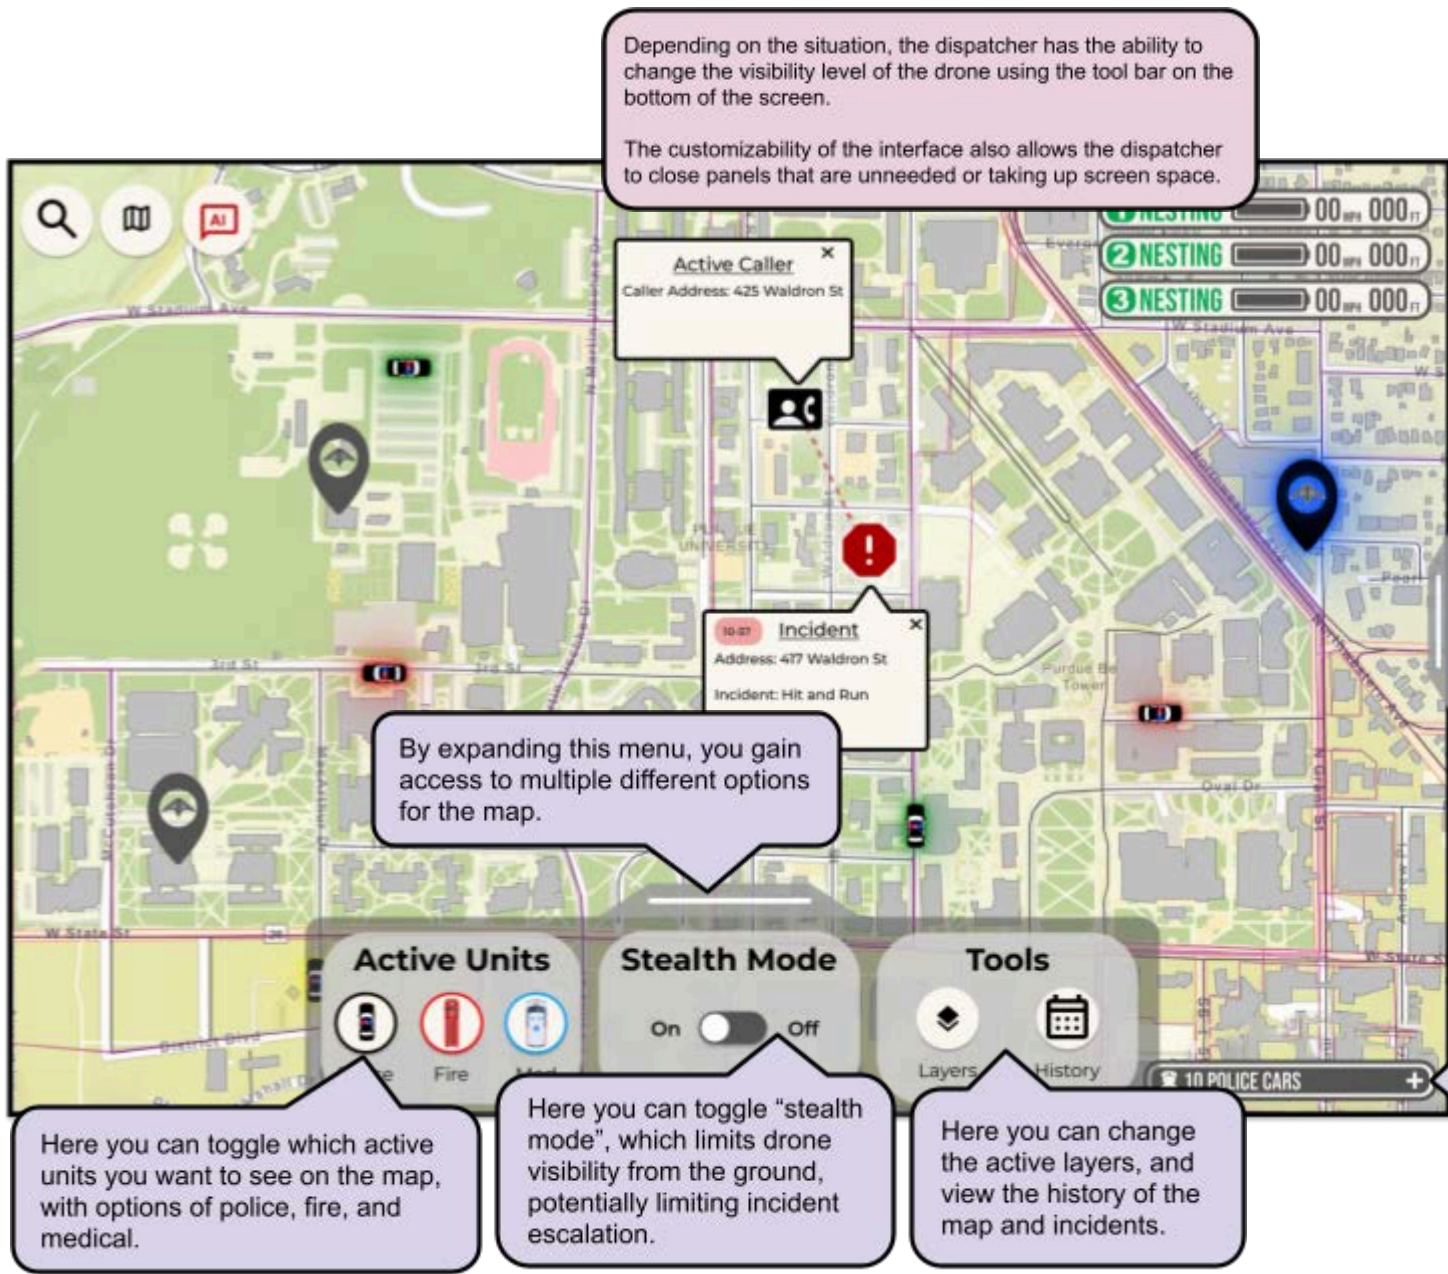

Changing Map Style

Clicking the middle of top left buttons changes the map style to the preference or need of the dispatcher. Considering the dark environment of the dispatch setting, a 'Dark Mode' (bottom) would put more ease on the dispatcher's eyes. The 'Satellite' view (right) on the other hand offers a more complex view of the area of focus and allows the dispatchers to analyze vegetation, building details and small things such as the existence of a shed or covering.

Default/Dark/Satellite
Mode toggle

Depending on the situation, the dispatcher has the ability to change the visibility level of the drone using the tool bar on the bottom of the screen.

The customizability of the interface also allows the dispatcher to close panels that are unneeded or taking up screen space.

Active Caller x
Caller Address: 425 Waldron St

Incident x
Address: 417 Waldron St
Incident: Hit and Run

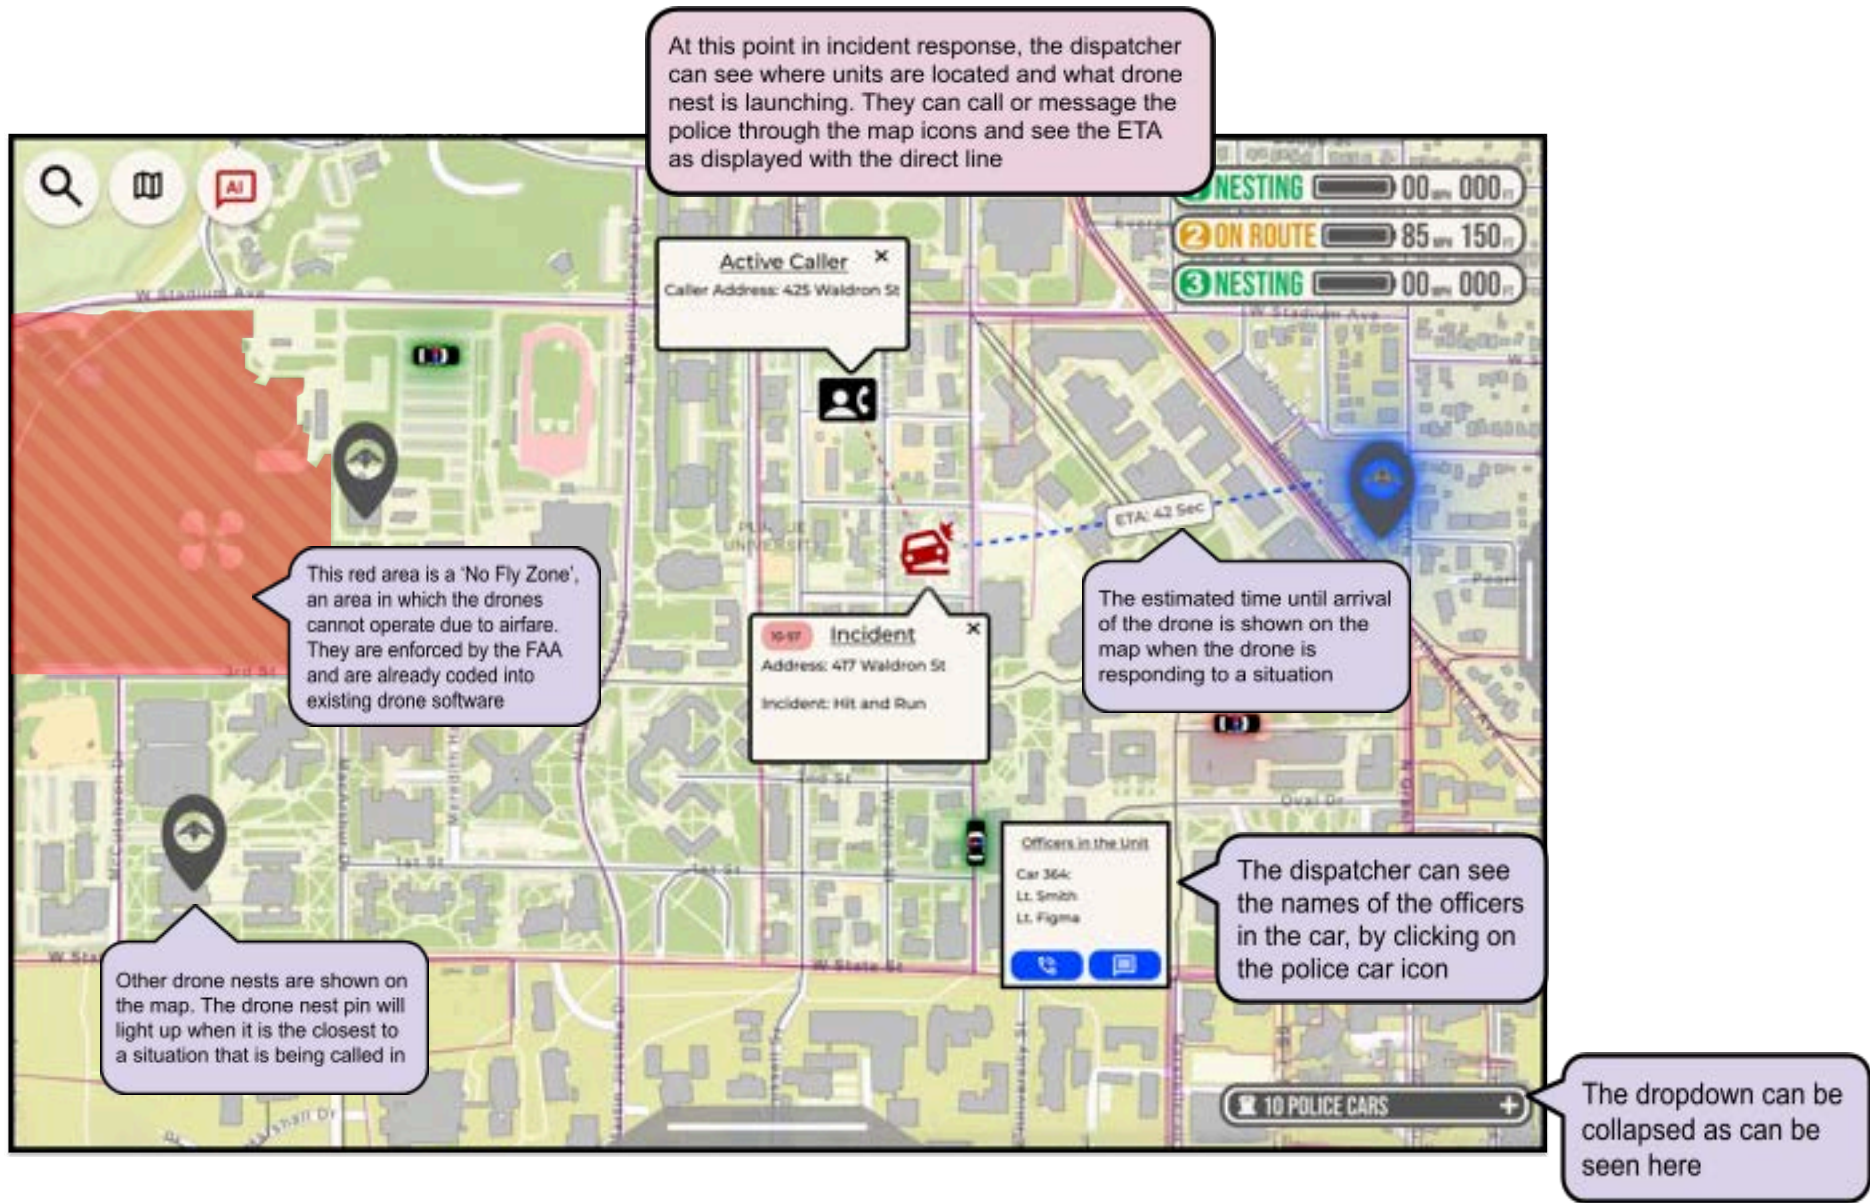

By expanding this menu, you gain access to multiple different options for the map.

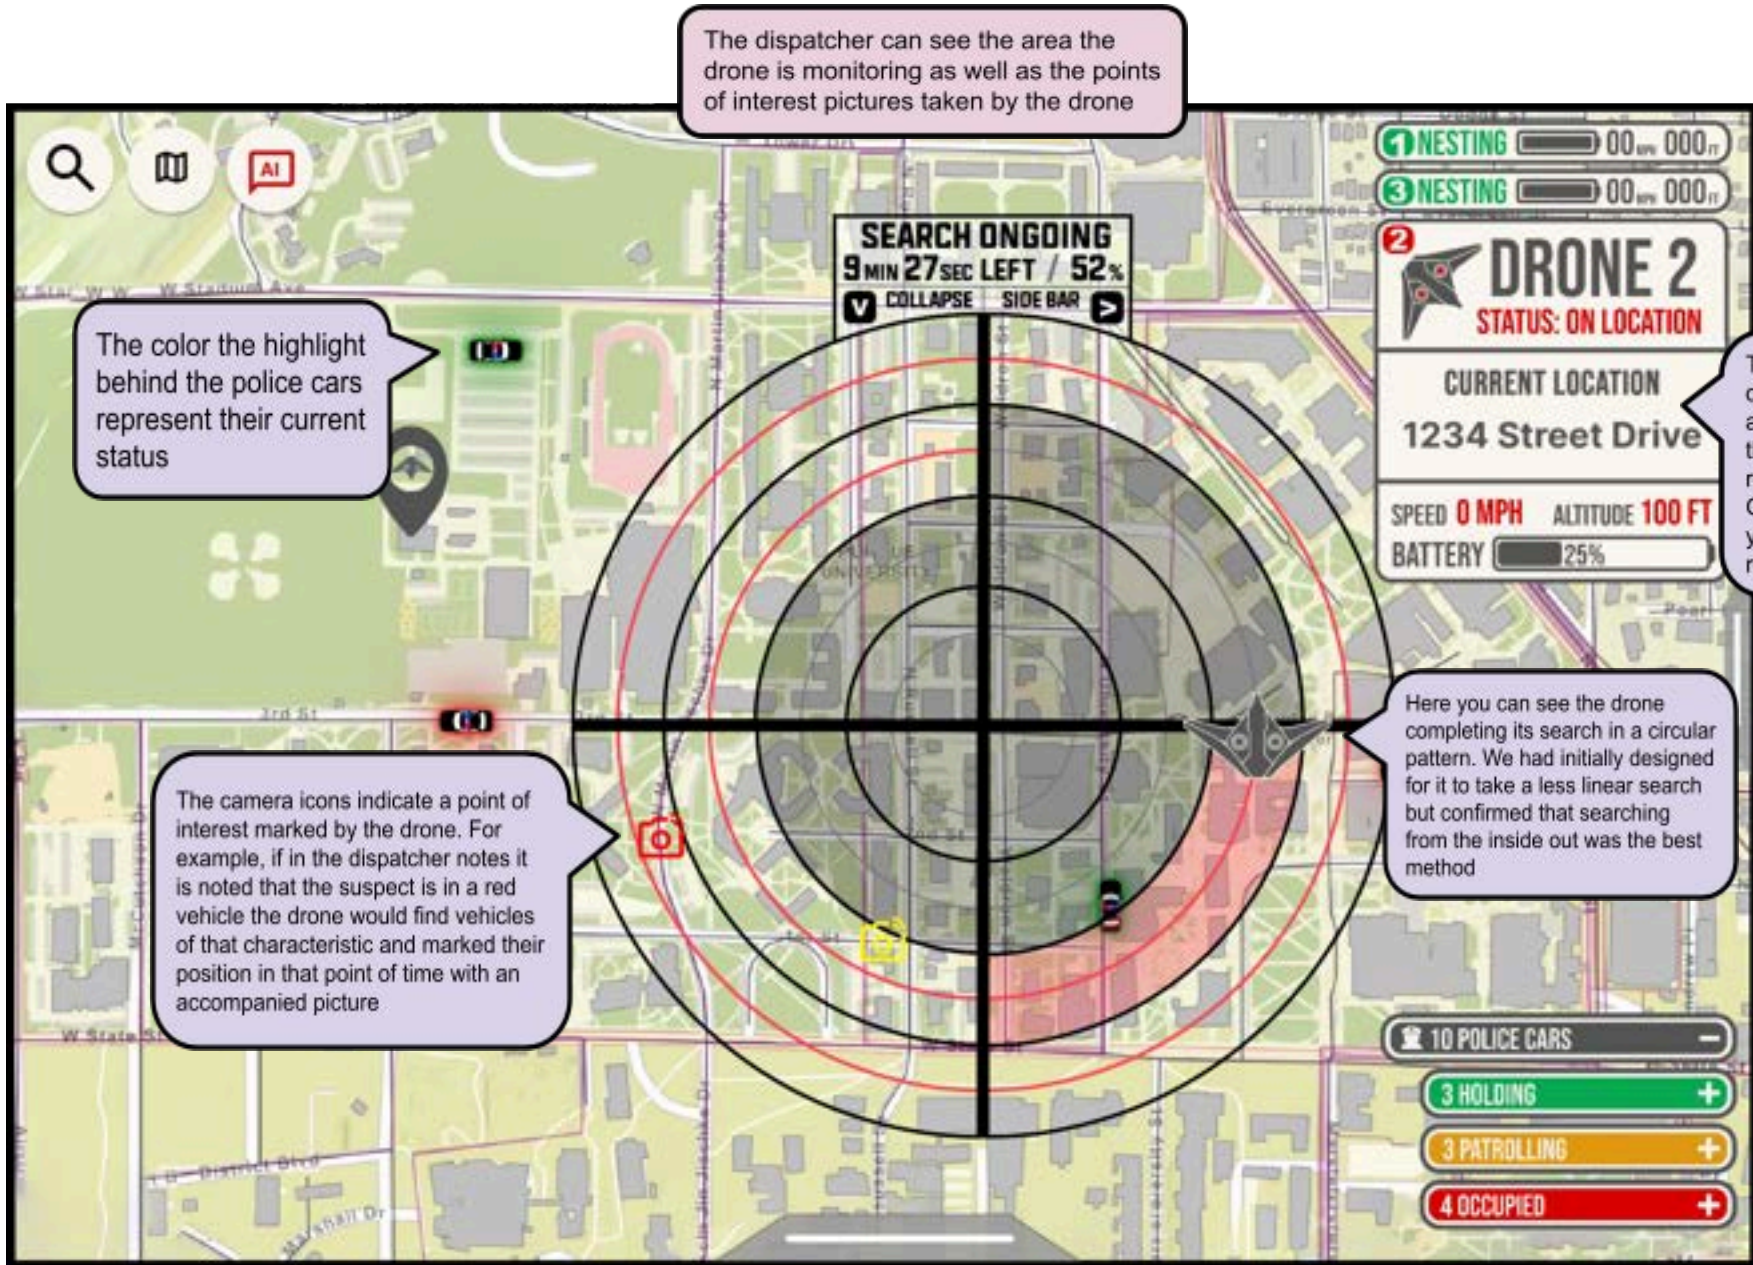

Here you can toggle which active units you want to see on the map, with options of police, fire, and medical.

Here you can toggle "stealth mode", which limits drone visibility from the ground, potentially limiting incident escalation.

Here you can change the active layers, and view the history of the map and incidents.

The police cars menu can be collapsed and expanded, from showing just the number of cars, the number of each car status, and can even be expanded to show each car.

The dispatcher can see the area the drone is monitoring as well as the points of interest pictures taken by the drone

The color the highlight behind the police cars represent their current status

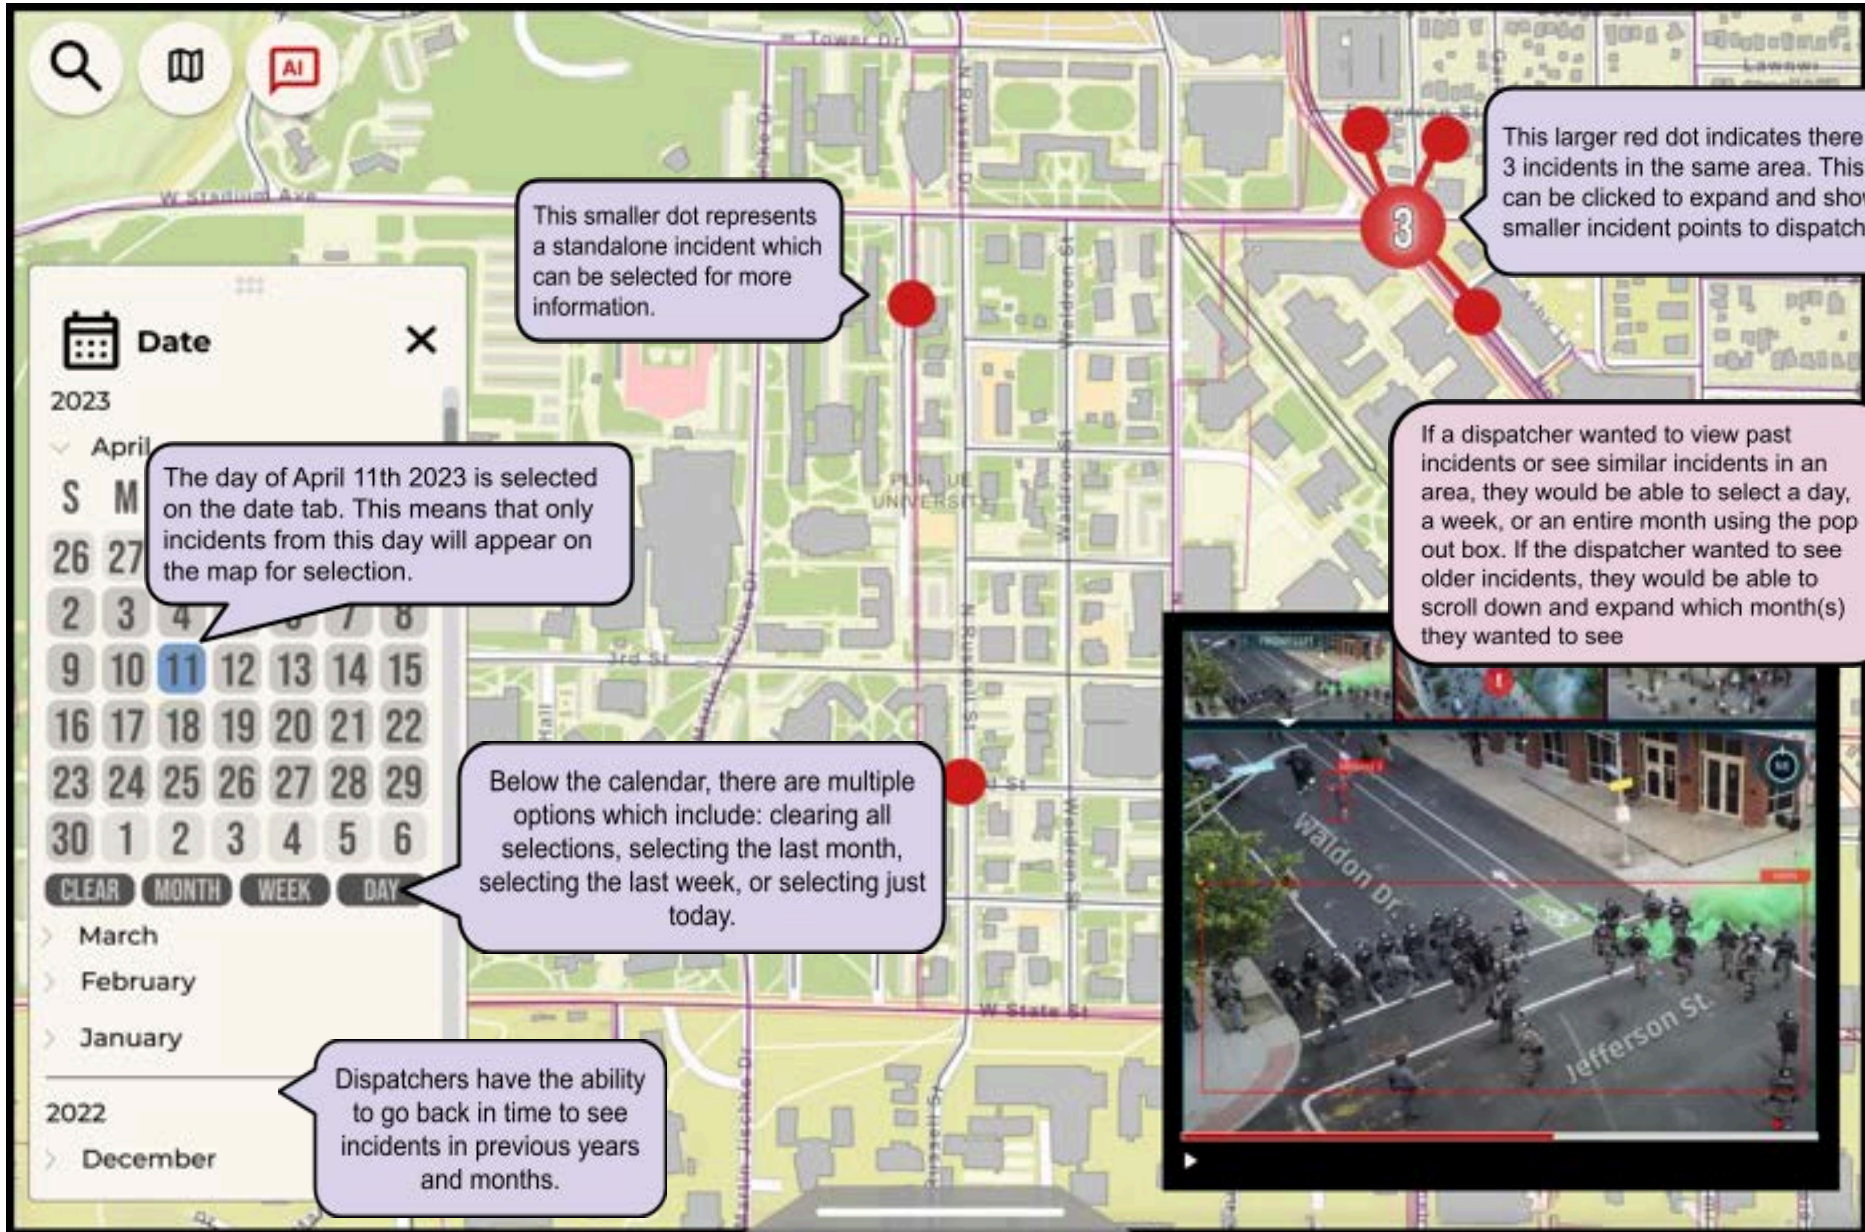

The camera icons indicate a point of interest marked by the drone. For example, if in the dispatcher notes it is noted that the suspect is in a red vehicle the drone would find vehicles of that characteristic and marked their position in that point of time with an accompanied picture

DRONE 2
STATUS: ON LOCATION
CURRENT LOCATION
1234 Street Drive
SPEED 0 MPH ALTITUDE 100 FT
BATTERY 25%

The information for this drone has been clicked and expanded. This is the drone that is responding to the call. Green is a nesting drone, yellow is in-transit, and red is active.

Here you can see the drone completing its search in a circular pattern. We had initially designed for it to take a less linear search but confirmed that searching from the inside out was the best method

10 POLICE CARS
3 HOLDING
3 PATROLLING
4 OCCUPIED

This smaller dot represents a standalone incident which can be selected for more information.

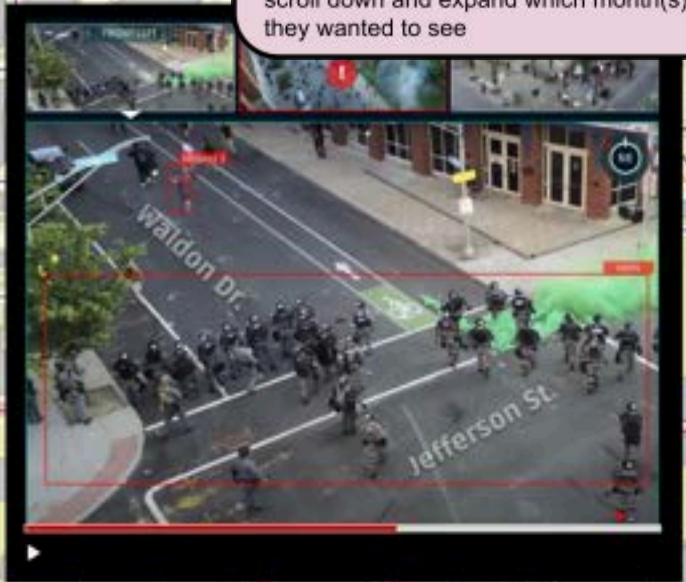

This larger red dot indicates there are 3 incidents in the same area. This dot can be clicked to expand and show the smaller incident points to dispatchers.

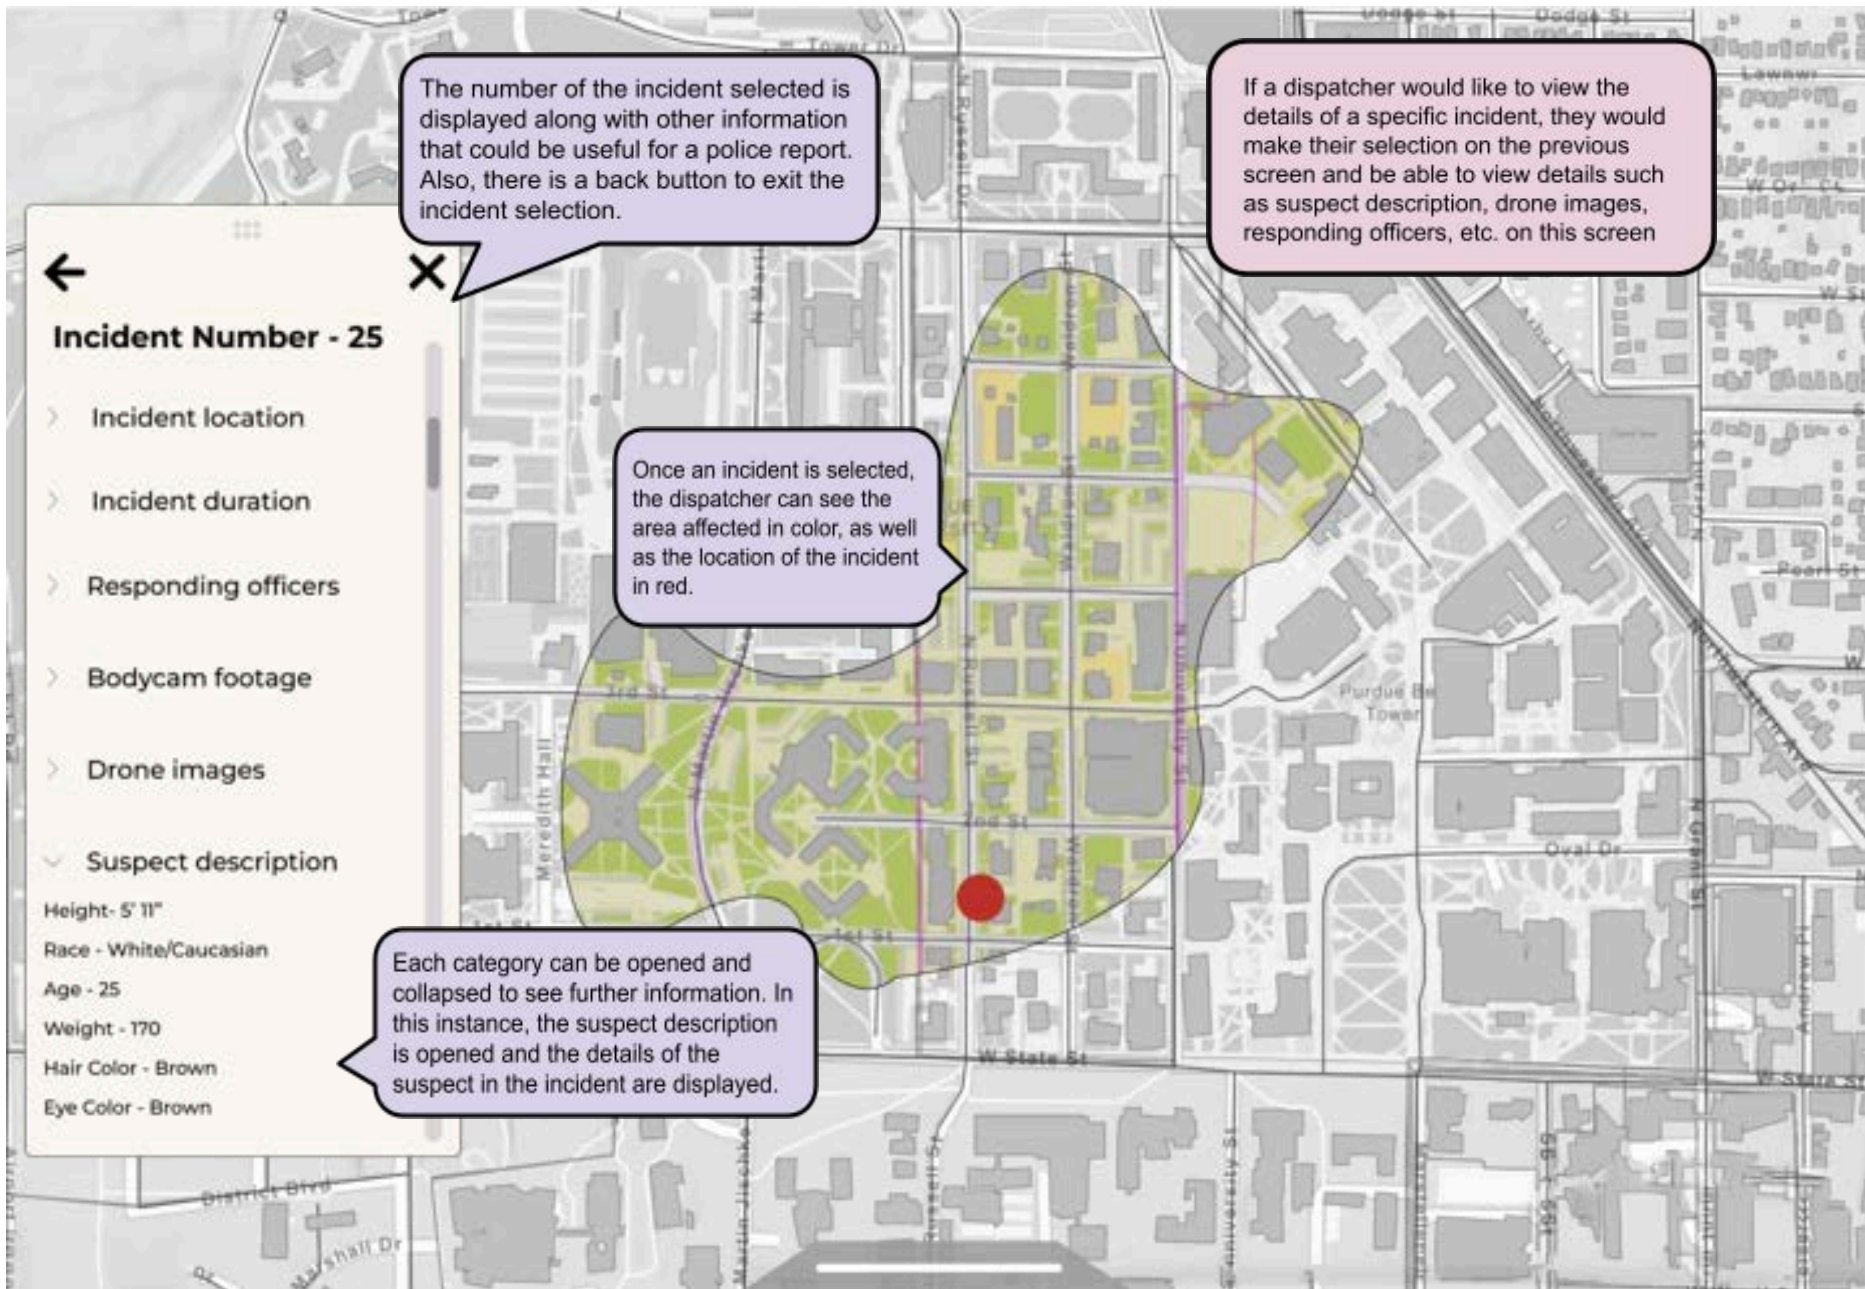

The day of April 11th 2023 is selected on the date tab. This means that only incidents from this day will appear on the map for selection.

If a dispatcher wanted to view past incidents or see similar incidents in an area, they would be able to select a day, a week, or an entire month using the pop out box. If the dispatcher wanted to see older incidents, they would be able to scroll down and expand which month(s) they wanted to see

Below the calendar, there are multiple options which include: clearing all selections, selecting the last month, selecting the last week, or selecting just today.

Dispatchers have the ability to go back in time to see incidents in previous years and months.

The number of the incident selected is displayed along with other information that could be useful for a police report. Also, there is a back button to exit the incident selection.

If a dispatcher would like to view the details of a specific incident, they would make their selection on the previous screen and be able to view details such as suspect description, drone images, responding officers, etc. on this screen

Once an incident is selected, the dispatcher can see the area affected in color, as well as the location of the incident in red.

Each category can be opened and collapsed to see further information. In this instance, the suspect description is opened and the details of the suspect in the incident are displayed.

Design “Maybes”

AI Chat with Drone System:

A flexible and iterative way a dispatcher could communicate with drones. They could type into this panel on their dispatch setup and communicate with the drone, whether that be with commands, questions, or further explanations.

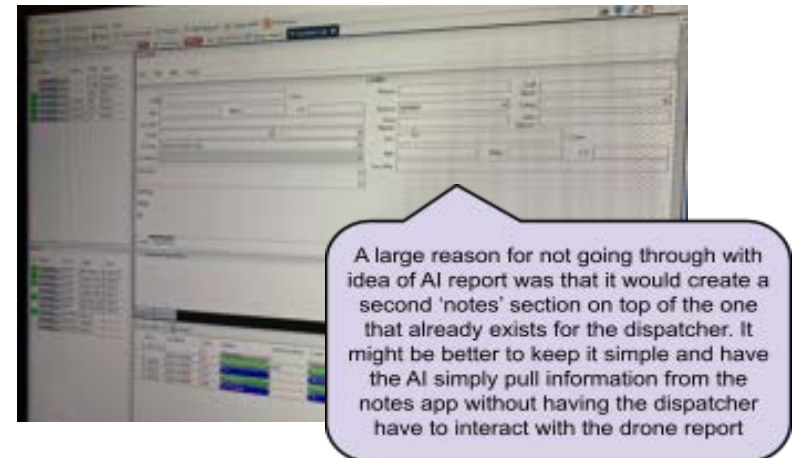

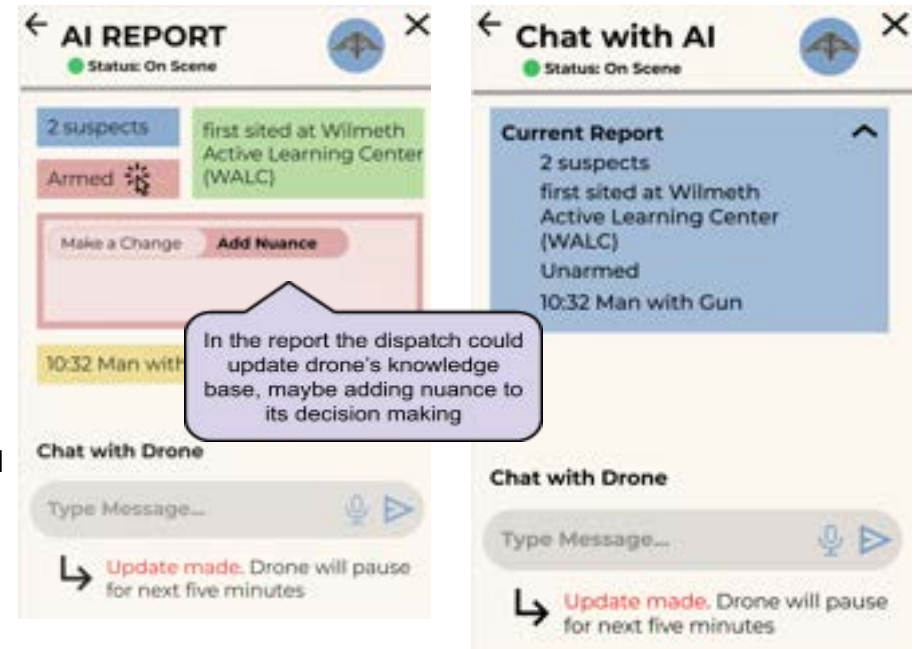

Justification for design: interview insights from our sponsor, testing with operator, and wanting to give operators the ability to question drone’s decision making. The ongoing success of CHATGPT also helped

Concerns:

- 1) **Recognition over recall** - buttons are easier for an operator to choose, overlap with existing CAD notes
- 2) **Balance of control** - the drone is autonomous for a reason, giving greater control to police/dispatch might result in the same issues that spurred the creation of this drone in the first place

Based on our testing with a 911 dispatcher, we found that police notes and past information is where they gain a better understanding of the situation. Therefore, we decided to shift the AI chat to a report that combines police notes and past information and allows the dispatcher to:

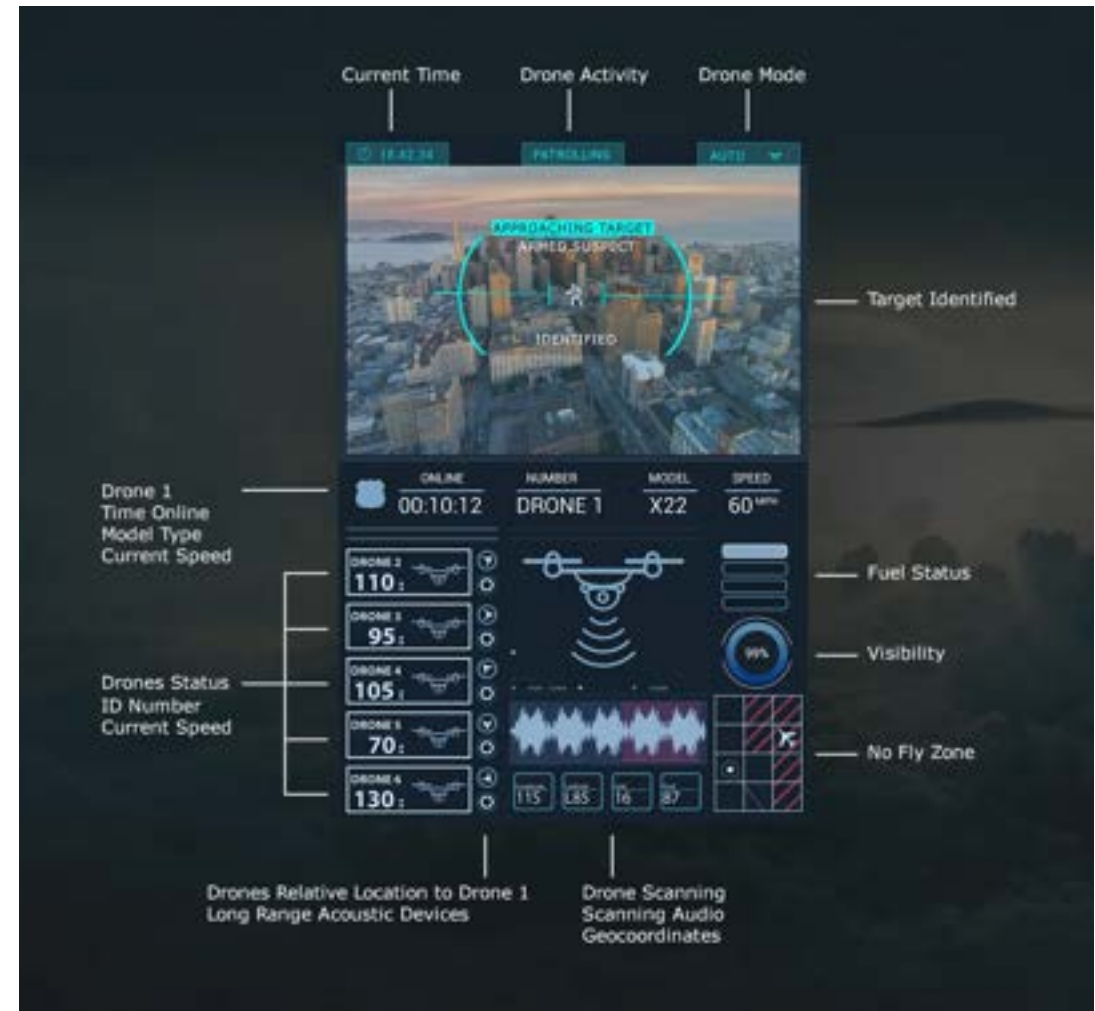

- Update information that may be changing as the situation persists
- Add nuance to situation in order to give more detail to AI/drone

3D Maps and Camera Views

Having more complex views of a map from spatial background of buildings and artifacts could give an opportunity for dispatchers to have a more complete understanding of the incident area.

Also doing more with camera views and viewing of drone behavior could be interesting. It's obvious talking to police that they would demand that they knew what the drone was doing and have the ability to stop it in case the AI made errors or there were some other problem.

Secondary Research *much more detail can be found in [appendix](#)

Goal

Our goal was to gain more insight into our problem space and to better understand how to move forward with creating designs that would accurately fit within our scope. We first wanted to learn more about 911 dispatchers and their current set up to learn how we could integrate our solution. We also wanted to see how drone mapping is currently done for other companies. We did this to see if there were any key points that we would need to add into our designs to make them as understandable as possible.

Approach

To do this, we all individually researched different topics that would aid in better understanding dispatcher terminology, their process, and Socian drones. We also conducted a comparative analysis to see what currently exists for drone interfaces. We looked at interfaces for non-autonomous drone cameras, as well as interfaces for drone mapping, that show the location and flight plan of the drone.

Insights about 911 Dispatchers

- Dispatchers currently use **Computer-Aided Dispatch (CAD)** for mapping
- **Dispatchers would be the primary user of the interface**
- Dispatchers communicate important information with officers over radio
- Dispatchers input location into CAD, so the first responders know where to go

Insights about Competitive Analysis

- Current drone interfaces are primarily for non-autonomous drones
- Interfaces contain **key information** about the drone
 - Speed, altitude, battery, etc.
- The interfaces are typically **simple**, only containing what is necessary

Dispatcher Tour

In order to gain a better understanding and background of our user group, 911 dispatchers, we went to West Lafayette Police Department's dispatcher center on Purdue's campus.

We interviewed a dispatch supervisor and the head of the WLPD drone department to understand:

- 1) Pain points operators face when using CAD and interacting with maps
- 2) Current implementation of police drones & situations they're used for
- 3) 911 dispatcher's environment and job responsibilities

Insights:

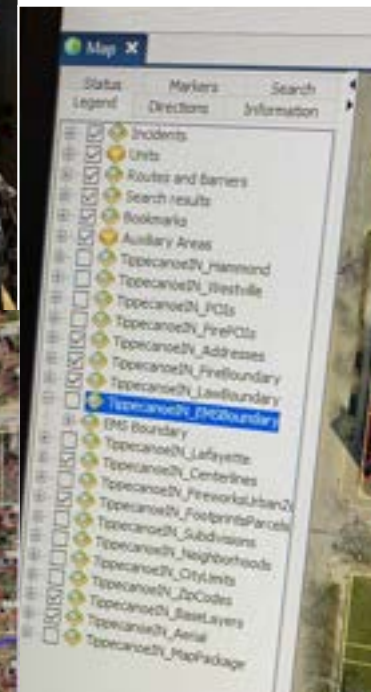

[Transcript of Tour](#)

Dispatcher setup consists of multiple screens where operators have the **ability to customize**:

- 1) **Map data layers** such as county lines, addresses, neighborhoods, units, incidents
- 2) **CAD screen setup** which consists of map, radio, police notes, chat with officers, and record of incidents

Jason's insight of dispatcher setup:

- 1) They see **vegetation as not-so-necessary** information in most cases.
- 2) **Address points are essential** to help police for identifying the jurisdiction
- 3) **Data layers** are usually set by dispatcher during on boarding and then **not really used**

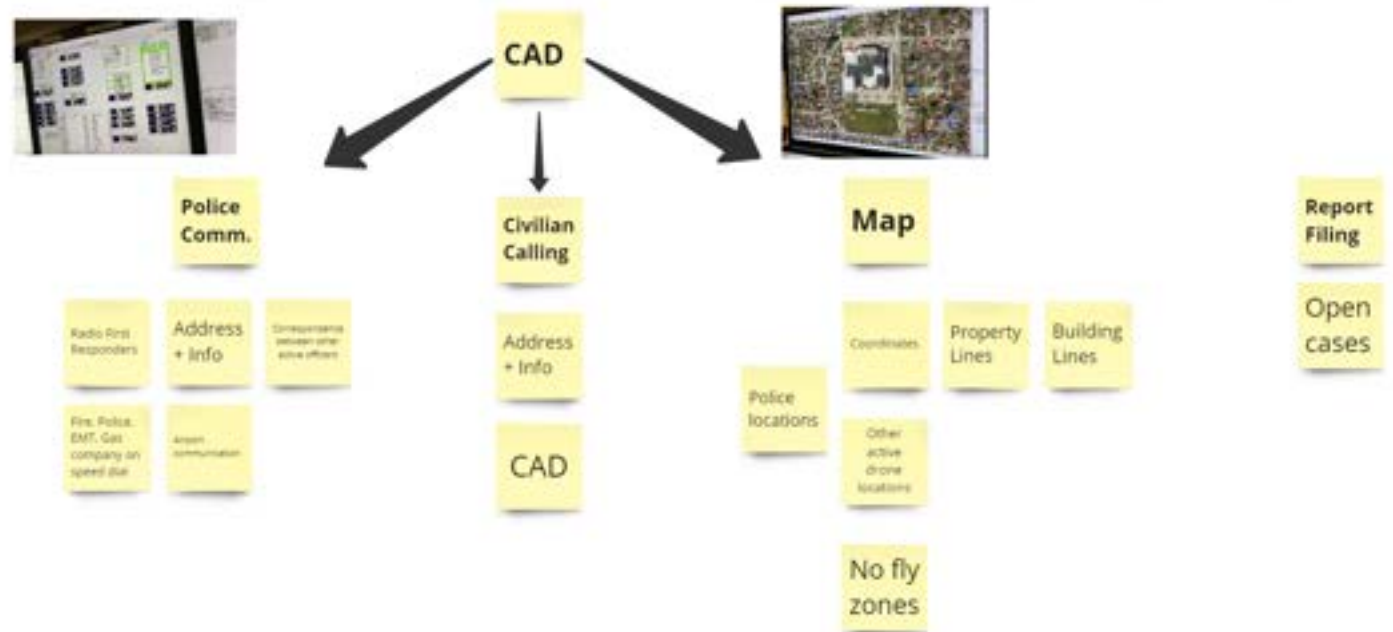

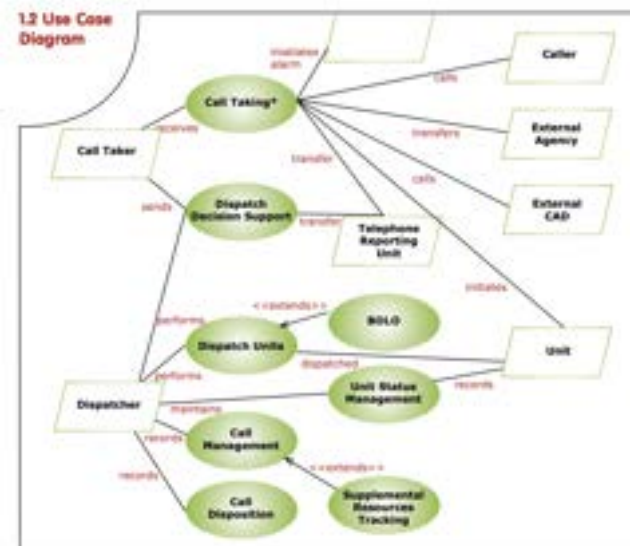

Sargent's explanation of police drone use and surveillance:

- 1) Drones are mainly used for **missing persons** and for **surveying large areas of terrain**
- 2) Drones and surveillance cameras have the **ability to read license plates**, but do not have facial recognition
- 3) The live feed from the drones will be helpful in many cases as they can **lock the movement of the suspect**

Essential Information for Map Interface

Here we have combined everything from the interviews and the things that we found in our secondary research so that we can finalize on the basic structure for the map. We also tried to incorporate our ideas so that we can better address this problem space and make drone maps similar to the current CAD system that they use so there is no new learning curve for the dispatcher who is using our map for

Above left is a diagram from the "Standard Functional Specifications for... Law Enforcement Computer Aided Dispatch (CAD) Systems" - https://bja.ojp.gov/sites/g/files/xyckuh186/files/media/document/leitsc_law_enforcement_cad_systems.pdf

Dispatcher Testing

Goal

Our goal was to test out our designs with a dispatcher, to see how effective they were. We also wanted to test how easily understandable the designs would be for a 911 dispatcher.

Approach

To do this, we talked to a 911 dispatcher over Zoom about our designs. We showed them to him and asked for any feedback on the things he appreciated and things that could be changed about the designs.

Insights

- Their setup is already complicated and they **do not want to feel overloaded**
- **Police codes** are important to add, but not the full address
- Wanted to be able to **add nuance** to the drone's knowledge
- Likes being able to change the visibility of the drone to help with **not escalating the issue**
- Enjoy features like **color coded units** to know what police on duty are doing
- Wants **layers to be less visible** because they are not used often

Conclusion

Our goal was to test out our designs with a dispatcher, to see how effective they were. We also wanted to test how easily understandable the designs would be for a dispatcher. During our interview with Jason Timmons (a West Lafayette dispatcher), we got the needed feedback to make some final changes to our design.

What Could Be Done in Future

Conclusion

To reflect back on our semester, as a team we were effectively able to communicate and deliver ideas in order to reach our goal. From starting with secondary research and competitive analysis, to really understanding our design space, to meeting with our sponsor to figure out the specifications of the drone and the current company's vision, to designing our final prototype solution for the end of the semester presentation. We were able to grow as a team not only in our UX design skills, but in our soft skills as well. We did hit a good amount of roadblocks along the way, however, overcoming a challenge was just another step closer to our final solution. We had a great time working on this project with Marc.

Future Steps

- Onboarding Feature: Allowing dispatchers to choose the layout that makes them the most comfortable to work with the interface
- AI Chat: Allowing the dispatchers the ability to message the drone questions and clarifications about the incident
- More concept testing with dispatchers: Understanding what changes still need to be implemented regarding the structure, aesthetic, content, and functionality of the interface
- The use of more data from the notes tab of the CAD setup, visualizing the information shared between units on the screen of the dispatchers setup
- Pause/Stop button: An override button that the dispatcher can press to stop drone actions/movement
- Make opacity meter for user to choose between satellite and plain view, this way they could be in between of visibility of foliage and more detailed information but not a complete satellite view

Early Sketches

This early sketch shows what a handheld version of a map display would look like.

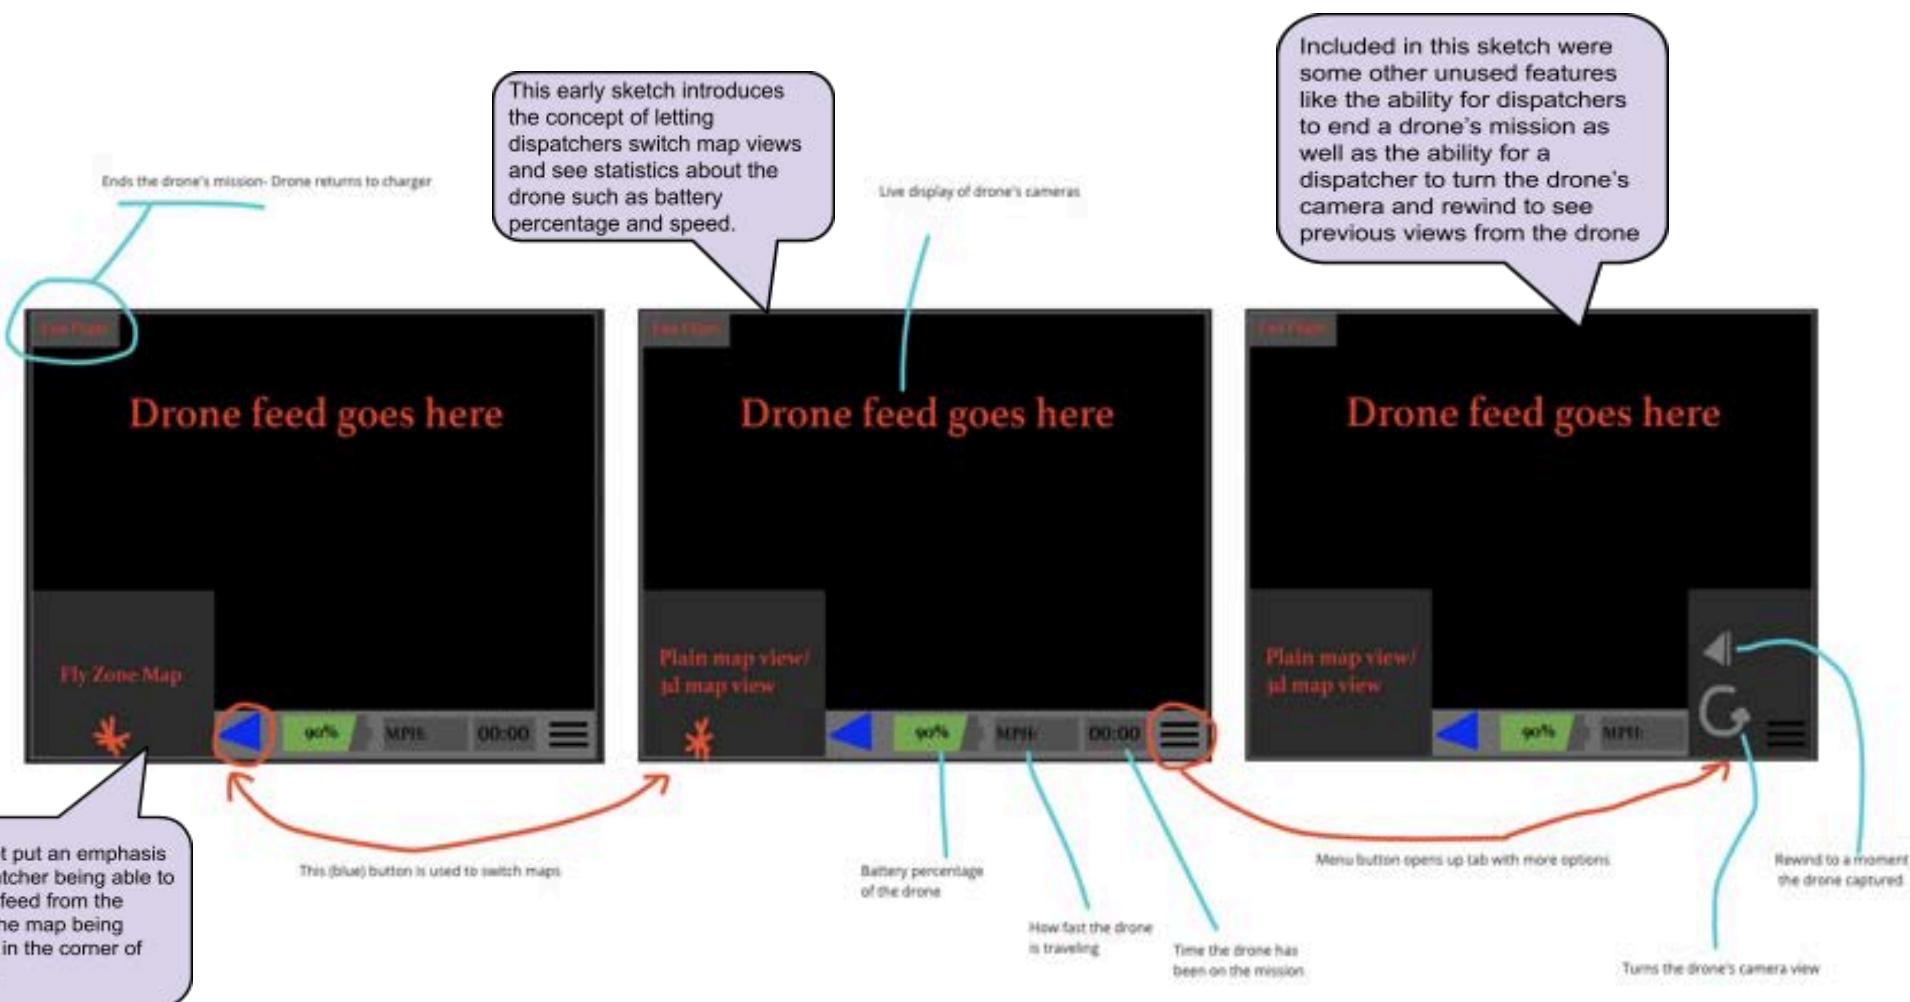

This is a design for a design that highlights the flight plan and location of the drone/incidents. The sidebar on the right shows what would show the camera view and the layers panel.

This was an initial idea for a dashboard that shows the locations of all the drones. We used the top profile icon of the drone on later designs.

This design shows what the first version of our map would look like (some of the features that stuck include incident toggles, no fly zones, drone location, and drone path)

This concept put an emphasis on the dispatcher being able to see the live feed from the drone with the map being expandable in the corner of the screen.

This early sketch introduces the concept of letting dispatchers switch map views and see statistics about the drone such as battery percentage and speed.

Included in this sketch were some other unused features like the ability for dispatchers to end a drone's mission as well as the ability for a dispatcher to turn the drone's camera and rewind to see previous views from the drone

This (blue) button is used to switch maps

Battery percentage of the drone

How fast the drone is traveling

Time the drone has been on the mission

Menu button opens up tab with more options

Turns the drone's camera view

Rewind to a moment the drone captured

This early sketch shows an interface that highlights incidents and has a street view, similar to Google Earth. It also has information buttons to see more about the drone.

This sketch shows a drone camera view, as well as other drone information, like altitude, coordinates, etc.

All three of these images show options that we considered using for the map interface. We ultimately decided on the one in our final design.

- Arson
- Assault
- Burglary
- Disturbing the Peace
- Drugs / Alcohol Violations
- DUI
- Fraud
- Homicide
- Motor Vehicle Theft
- Robbery
- Sex Crimes
- Theft / Larceny
- Vandalism
- Vehicle Break-In / Theft
- Weapons

This is a incident toggle concept that we found that we took some inspiration from.

This is a drone dashboard concept that we found that we took some inspiration from.

Primary Research

Dispatcher Tour Interview Protocol

- How do you use maps in your job?
- What programs/software do you use the most?
 - Which feature of the software do you like the most?
 - What would you like to be included?
 - What technology do you feel could be updated?
- What information is essential to have in regards to mapping?
 - What are the elements you want to see?
 - What information do you think isn't essential?
- How do you communicate with on the ground police?
- Do you use drones in this department?
 - What kind of situations would drones be used in?
- Do you collaborate with the fire department?
- Do you work with Axon and their products?
- Can you give an example of a complex or challenging drone mission you have flown, and how you handled it?
 - How does a drone help in that situation?

Dispatcher Concept Testing

To get feedback and test our concepts, we presented our interfaces to a 911 dispatcher. The screens were shown in order of how they would be presented when a dispatcher is responding to a call.

- What functionality, if any, would you want over a drone
 - drone visibility button: stealth mode?
- Do you have a search button, do you want one?
- Do you ever use a third party platform such as google to find answers? Do you prefer their interface?
- How valuable is screen space?
- In what types of incidents would call history and previous incidents be important?

- How do you currently access police notes? What are the pain points you experience when trying to access them?
- Would an AI chatbot be helpful in quickly receiving information?
- How often do you change your map settings such as layers or map style?
- Do you need the full address with the town, state, and area code?

Situational Awareness That Soars

By providing real-time visual insights from above, AirBoss enables public safety agencies to gather critical info and make better decisions, faster.

AirBoss for public safety is a game-changer in helping responders protect their own people, and the general public, in potentially hazardous situations.

See the Big Picture
AirBoss renders video, stills and thermal data into 2D and 3D models instantly.

Minimize Risk
Protect civilians and help personnel achieve their mission objectives with a complete UAS for public safety.

Connect Across Agencies
ATRA Integration enables cross-unit communication to improve operational effectiveness and responses.

Police Technology

→ [Other drone competitors](#)

- ◆ Increasingly being used by police to gain aerial vantage points for crime scene work, search and rescue, accident reconstruction, and crowd monitoring.
- ◆ Drones can be equipped with 3D mapping software to offer GPS-enhanced precisions to surveyed areas

→ License Plate Recognition

- ◆ Allows police to track a vehicle's movements over time, revealing details about an operator's whereabouts.

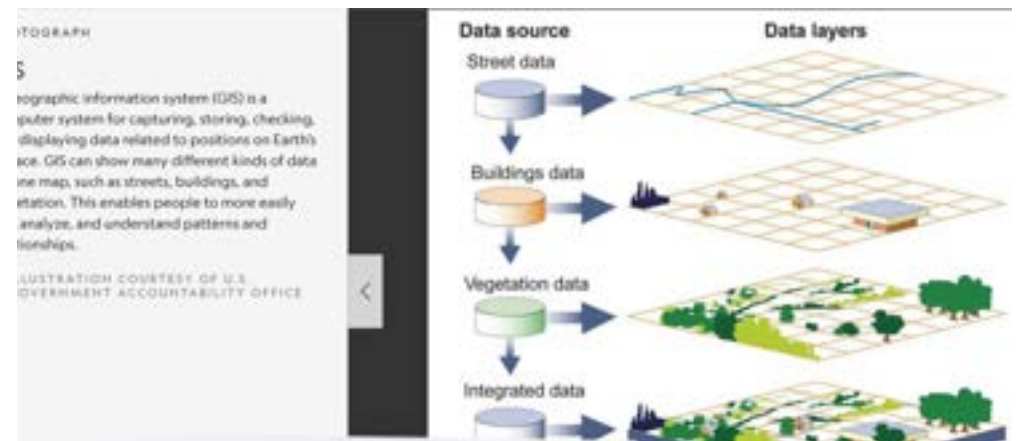

→ [Artificial Intelligence](#)

- ◆ Utilizing AI allows programmers to train computers to analyze data from a vast array of sources to predict when and where crimes are likely to occur
- ◆ AI makes it easier to share information and data between departments and agencies which allows easy cross-reference. Instead of what could take days of coordination between different police departments, AI can accomplish tasks more efficiently.

Current Computer Aided Dispatch (CAD) Map Software

→ Current maps used by operators use [Geographic Information System \(GIS\) data](#)

- ◆ GIS Displays all forms of geographically referenced information in layers
- ◆ 911 systems use GIS to map callers' location and support dispatch functions
- ◆ Calls are mapped based on callers:
 1. Caller's address range
 2. Street name and city information
- ◆ The caller's location is validated using the Master Street Address Guide (MSAG)

Thank you!
